INTEGRATED DESIGN-BUILD PROCESS

PSF's integrated design-build (IDB) process was developed to leverage the advantages of the design-build methodology and current virtual construction modeling technologies. Together, they enable the early development of engineering detailing and shop drawings that are electronically

transferred directly to our plasma cutter for real-time fabrication. Our BIM modeling capabilities not only enable better MEP coordination and clash detection, but also facilitate field labor planning and logistics; safety plans and procedures; and Lean construction methods.
